1 Introduction

1.1 Purpose

This document provides a technical approach for implementing ATM application, using a number of different architectural diagrams to view different aspects of the system. It also presents the decisions that will govern how the application will be built from .NET framework with C# programming perspective.

This document's aim is to describe the architecture at high level, in which the system will be described as a set of functional layers, with technologies suggested for each layers.

1.2 Scope

This document is prepared for the ATM simulator application in scope of the Assignemtn of FRESHER11.

1.3 Intended Audiences and Document Organization

This document is intended for:

- ❖ Development team: Developers
- ❖ Customer Representatives: Responsible to review & approve the document.

Below are main sections of the document:

- ❖ **Introduction** : This section describes the general introduction of this document
- ❖ **Architecture Design** : This section describes the high-level technical assessments and decisions for the application.
- ❖ **Data Design**: This section describes in detail how data is structured and manipulated in this application.
- ❖ **Interface Design**: This section describes in detail how UI is designed in general (layout , theme).
- ❖ **Application Security**: This section describes security matrix in detail
- ❖ **Configuration**: This section describes all configuration needed for the application to function properly.
- ❖ **Packaging and Deployment**: This section describes how applications could be packaged and deployed.

1.4 Acronyms and Abbreviations

#	Item	Description
1	ATM	Automated Teller Machine
2	PL	Presentation Layer
3	BLL	Business Logic Layer
4	DAL	Data Access Layer
5	DAO	Data Access Object, this object is responsible for attaching to a system, extracting some information, based on specific requirements, and creating a value object.
6	VO	Value Object
7	BE	Business Entities

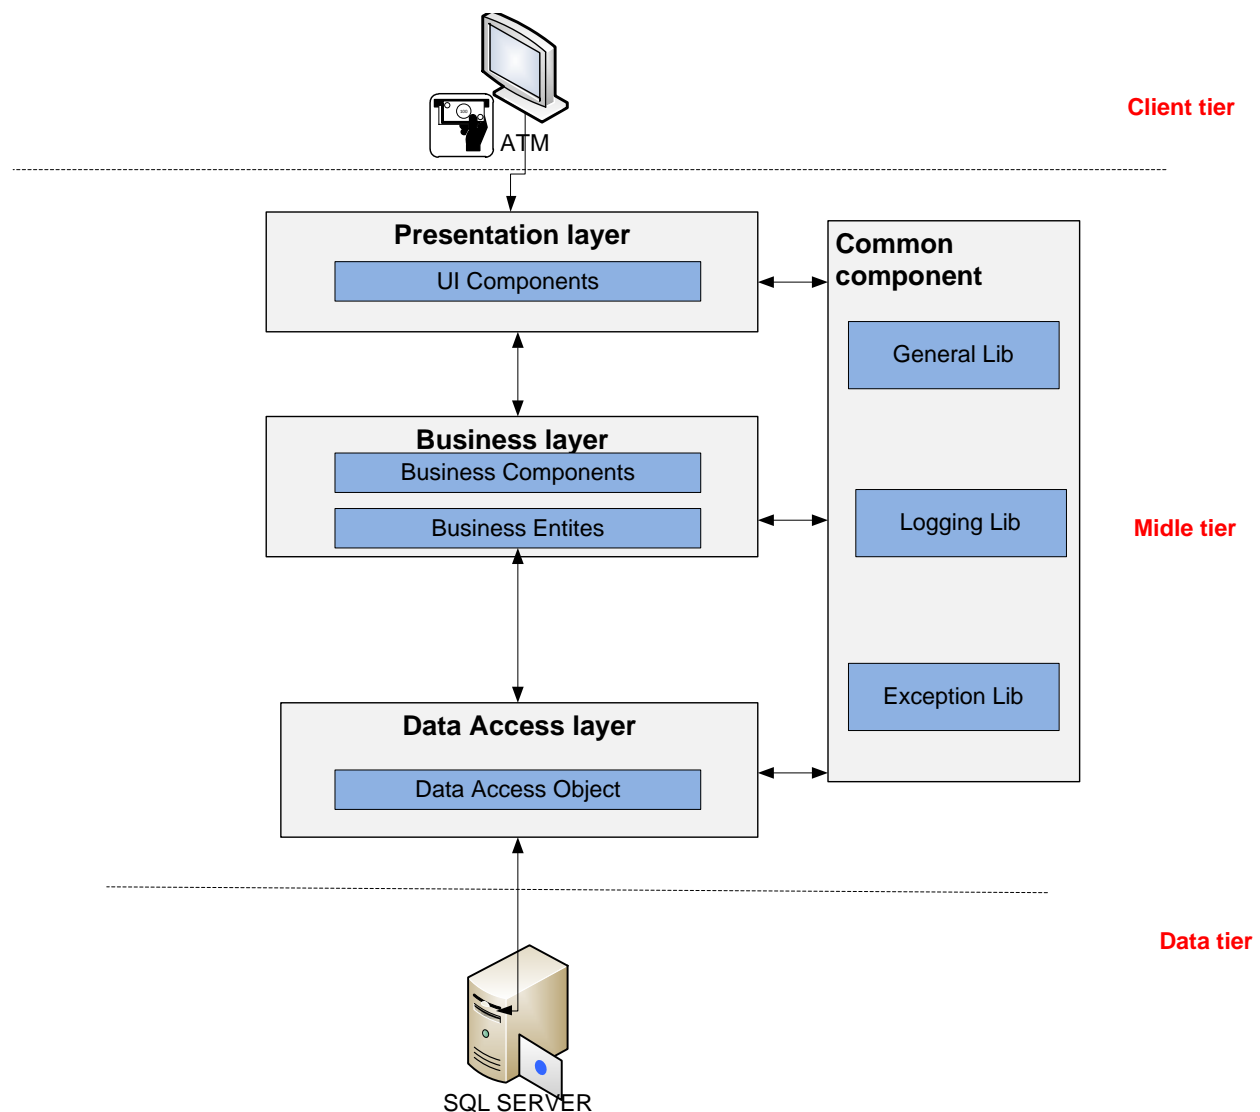

1.5 References

#	Title	Version	File Name / Link	Description

2				

Table 1.1: List of References

2 Architecture design

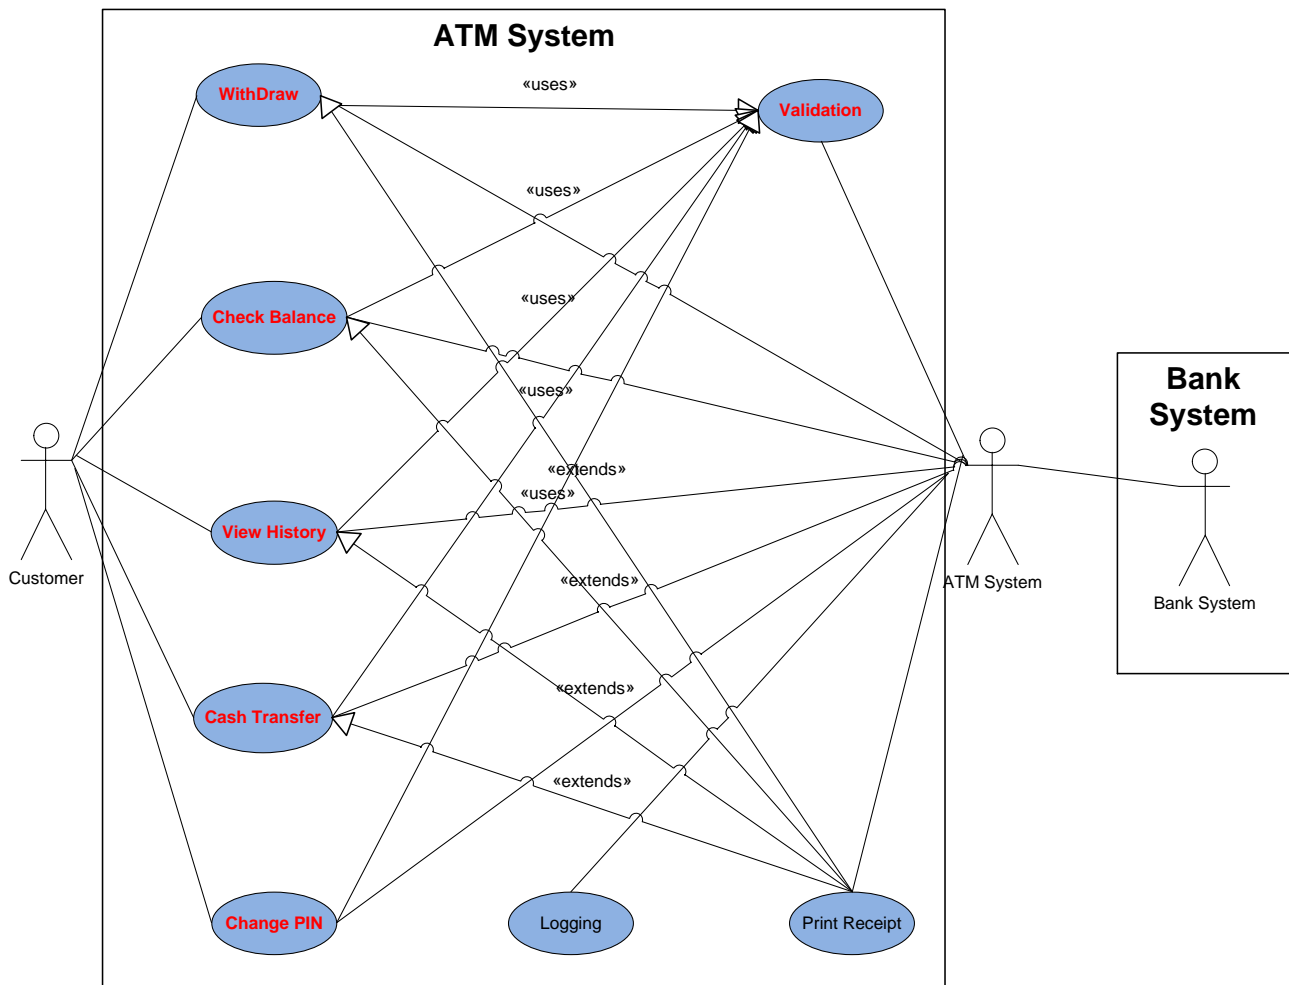

2.1 Application Logical Architecture

2.1 User case view

2.1.1 Overview

The following use cases are required to be included in the ATM simulator application

2.1.2 Description

UC	Name	Description
UC01	Validation	Validate customer card and PIN customer entered
UC02	Withdraw	Allow customer to withdraw money
UC03	Check balance	Allow customer to check their account balance
UC04	View history	Allow customer to view their succesful transaction
UC05	Cash Transfer	Allow customer to transfer their cash to another account in accepted bank system
UC06	Change PIN	Allow customer to change their PIN
UC07	Logging	System write log

2.2 Architectural Representation

The following diagram shows the primary tiers in the proposed n-tier architecture. This diagram shows the main layers in this architecture and the vision of how they fit together.

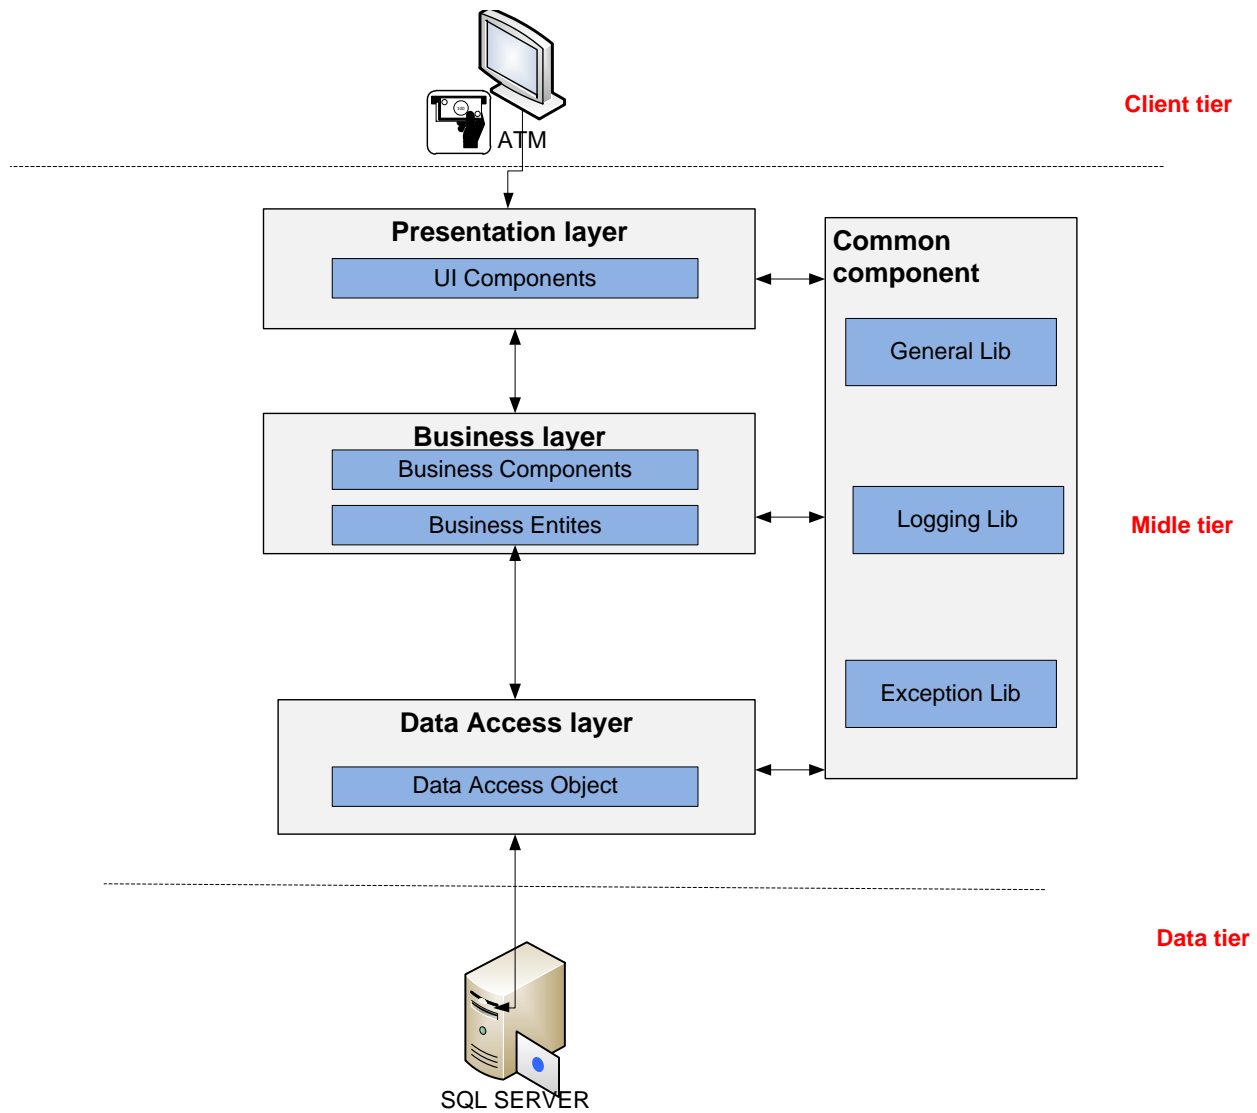

Figure 1 – N-tier architecture of ATM simulator system

2.2.1 Presentation Layer

This layer controls the display to the end user. The development framework is based on .NET Model architecture. The framework is responsible for:

- Managing requests/responses from/to the clients.
- Controlling display to the end user.
- Performing UI validation.
- Handling exceptions from other layers.

2.2.2 Business Layer

This layer manages the business processing rules and logic.

- Handling application business logic and business validation.
- Managing transactions.
- Allowing interfaces for interaction with other layers.
- Managing dependencies between business level objects.
- Adding flexibility between the presentation and the persistence layer so they do not directly communicate with each other.

- Exposing a context to the business layer from the presentation layer to obtain business services.
- Managing implementations from the business logic to the persistence layer.

2.2.3 Data Access Layer

This layer manages access to persistent storage. The primary reason to separate data access from the rest of the application is that it is easier to switch data sources and share Data Access Objects (DAOs) between applications.

This layer manages reading, writing, updating, and deleting stored data.

2.3 Packages/Components view

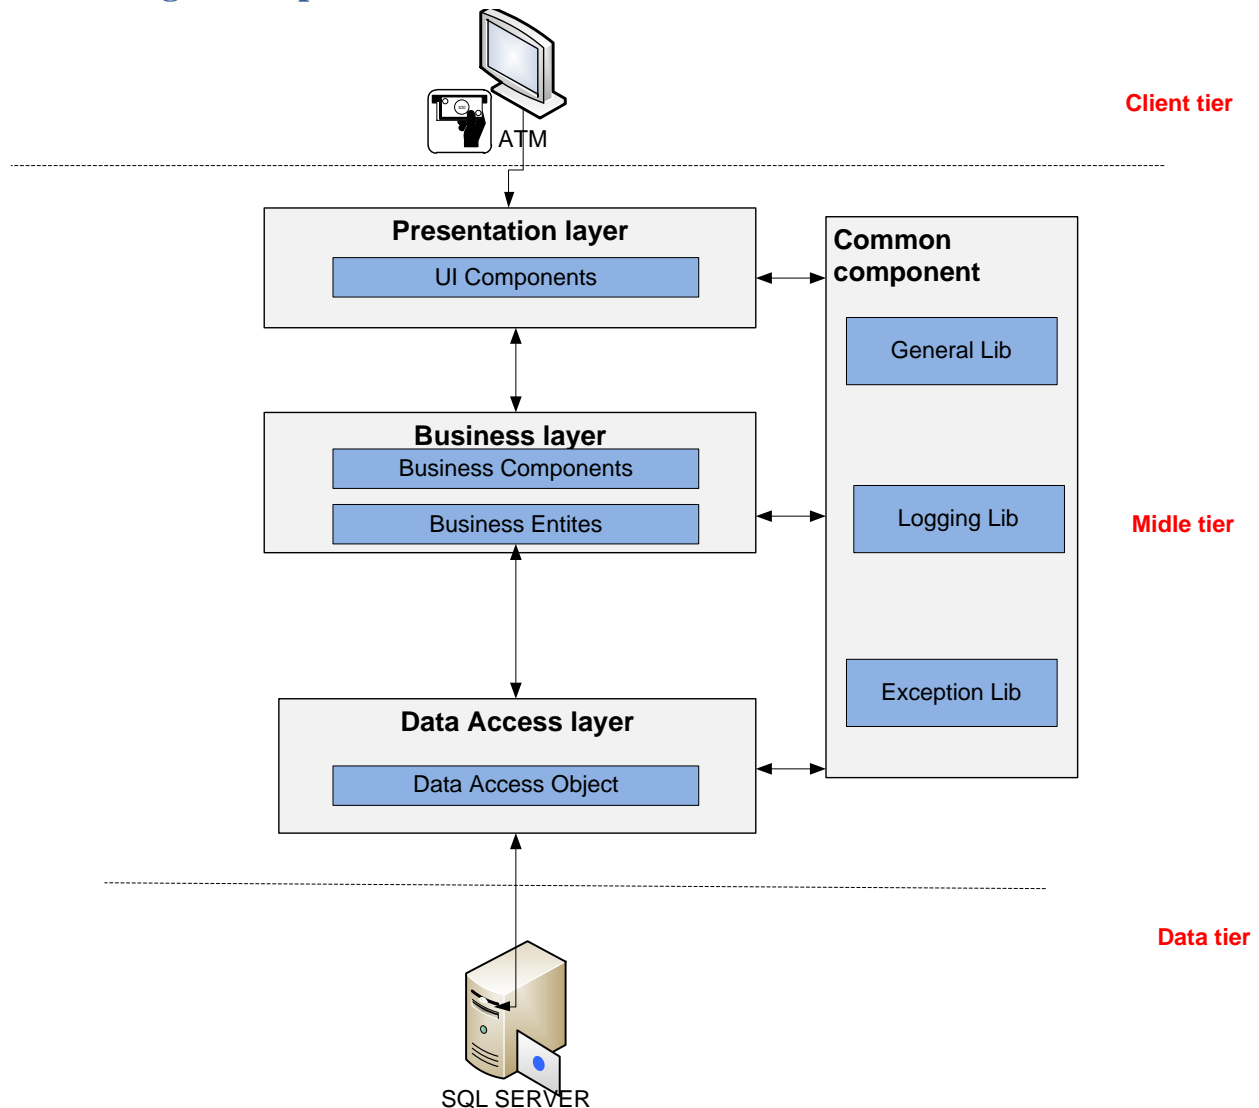

Figure 2 – Packages/Component view of ATM simulator system

2.2.4 UI Components

This package includes the implementation for the .NET architecture proposed to be used in the Presentation Layer to handle the display to the end user.

Validation: All validation of incoming requests parameters to the server should be validated using .NET client side control .

2.2.5 Business Entities

This package includes the implementation of business objects. **Business Entities** (BE) layer is used to perform the business operations. The Business Entities layer will access the DAO to access database. Transactions should be managed within this business layer.

2.2.6 Data Access Object

This package includes the implementation of Data Access Object. Using Linq to SQL classes here to make the application more flexible to access database. Linq to SQL classes includes basic functions to work with database: *select, insert, update, delete*.

2.2.7 Exceptions Lib

This package will include all general exceptions that will typically used by more than one package. The try-catch clauses should be kept to a minimum.

2.2.8 General Lib

This package includes all utilities .NET classes will be wisely used in the modules.

2.2.9 Logging Lib

This package includes implemented logging classes.

3 Technical Solutions

3.1 Exception handling mechanism

The try-catch clauses should be kept to a minimum.

Whenever an exception raise , system will log exception detail to Windows event and redirect user to Error page to display standard error message!

3.2 Logging mechanis

4 Database design HuyVQ4

4.1 Entity Relationship Diagram

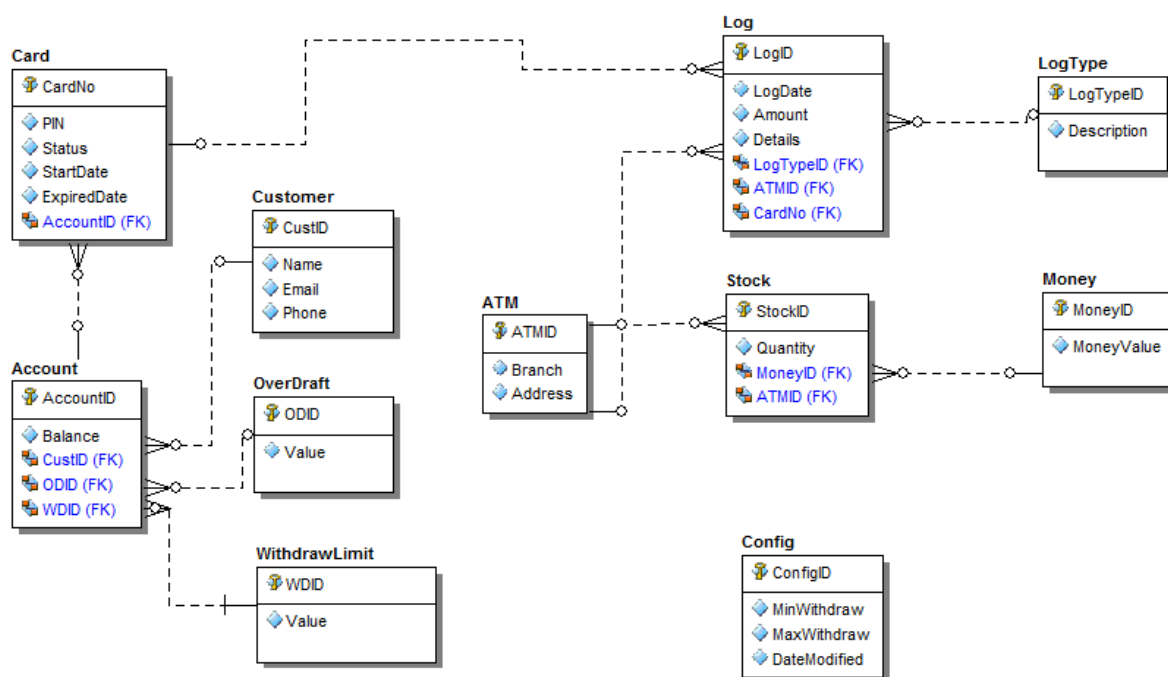

Figure 3 – Data overview

4.2 Schema

Overview

STT	Name	Description
1	Customer	List all Customer
2	Account	List all account use in system
3	Card	List all ATM card use in system
4	OverDraft	Amount of money that an account can over draft
5	WithdrawLimit	Limit of amount that an account can withdraw for a day
6	ATM	List all ATM use in system
7	Money	Kind of money and value
8	Stock	Kind of money and quantity of each kind stored in each ATM
9	Log	Log any transaction of customer
10	LogType	Kind of Log: Withdraw, transfer, check balance, change pin
11	Config	Store all system config: minwithdraw, maxwithdraw, number

		records per search results.
--	--	-----------------------------

4.3 Detail Schema

4.3.1 Customer

Customer				
	Field name	Type	Max Length	Description
1	CustID	int		Store ID of Customer
2	Name	nvarchar	100	Store name of Customer
3	Phone	Varchar	50	Store phone number of Customer
4	Email	Varchar	100	Store email address of Customer
5	Addr	Nvarchar	200	Address of Customer

4.3.2 Account

Account				
	Field name	Type	Max Length	Description
1	AccountID	int		Store ID of Account
2	CustID	Int		Store ID of Customer
3	AccountNo	Varchar	50	Store Account Number
4	ODID	Int		Store ID of OverDraft Limit
5	WDID	Int		Store ID of WithDraw Limit
6	Balance	Decimal		Store amount of money left in account

4.3.3 Card

Card				
	Field name	Type	Max Length	Description
1	CardNo	Varchar	16	Store Card number
2	Status	Varchar	30	Store status of card: block, normal ...
3	AccountID	Int		Store Account ID
4	PIN	Varchar	6	Store the PIN code of Card
5	StartDate	Datetime		Date of created
6	ExpiredDate	Datetime		Date of expire.
7	Attempt	Int		Entered invalid PIN times of customer

4.3.4 OverDraft Limit

OverDraft				
	Field name	Type	Max Length	Description
1	ODID	Int		ID of overdraft limit
2	Value	Decimal		Value of overdraft limit that an account can overdraft

4.3.5 WithDraw Limit

OverDraft				
	Field name	Type	Max Length	Description
1	WDID	Int		ID of withdraw limit

2	Value	Decimal		Value of withdraw limit that an account can withdraw for a day.
---	-------	---------	--	---

4.3.6 ATM

ATM				
	Field name	Type	Max Length	Description
1	ATMID	Int		ID of ATM
2	Branch	Nvarchar	50	Branch name
3	Address	Nvarchar	100	Location of ATM

4.3.7 Money

Money				
	Field name	Type	Max Length	Description
1	MoneyID	Int		ID of money use in system
2	MoneyValue	Decimal		Value of kind of money
3	Address	Nvarchar	100	Location of ATM

4.3.8 Stock

Stock				
	Field name	Type	Max Length	Description
1	StockID	Int		ID of stock record
2	MoneyID	Int		Store ID of kind of money
3	ATMID	Int		Store ID of ATM
4	Quantity	Int		Store quantity of each kind of money in each ATM

4.3.9 LogType

LogType				
	Field name	Type	Max Length	Description
1	LogTypeID	Int		ID of log type use in system
2	Description	Nvarchar	100	Name or details of log type

4.3.10 Log

Log				
	Field name	Type	Max Length	Description
1	LogID	Int		ID of log record
2	LogTypeID	Int		ID of log type
3	ATMID	Int		ID of ATM
4	CardNo	Varchar	16	Number of ATM Card
5	LogDate	Datetime		Date when transaction happen.
6	Amount	Decimal		Amount of transaction
7	Details	Varchar	100	Description about transaction

4.3.11 Config

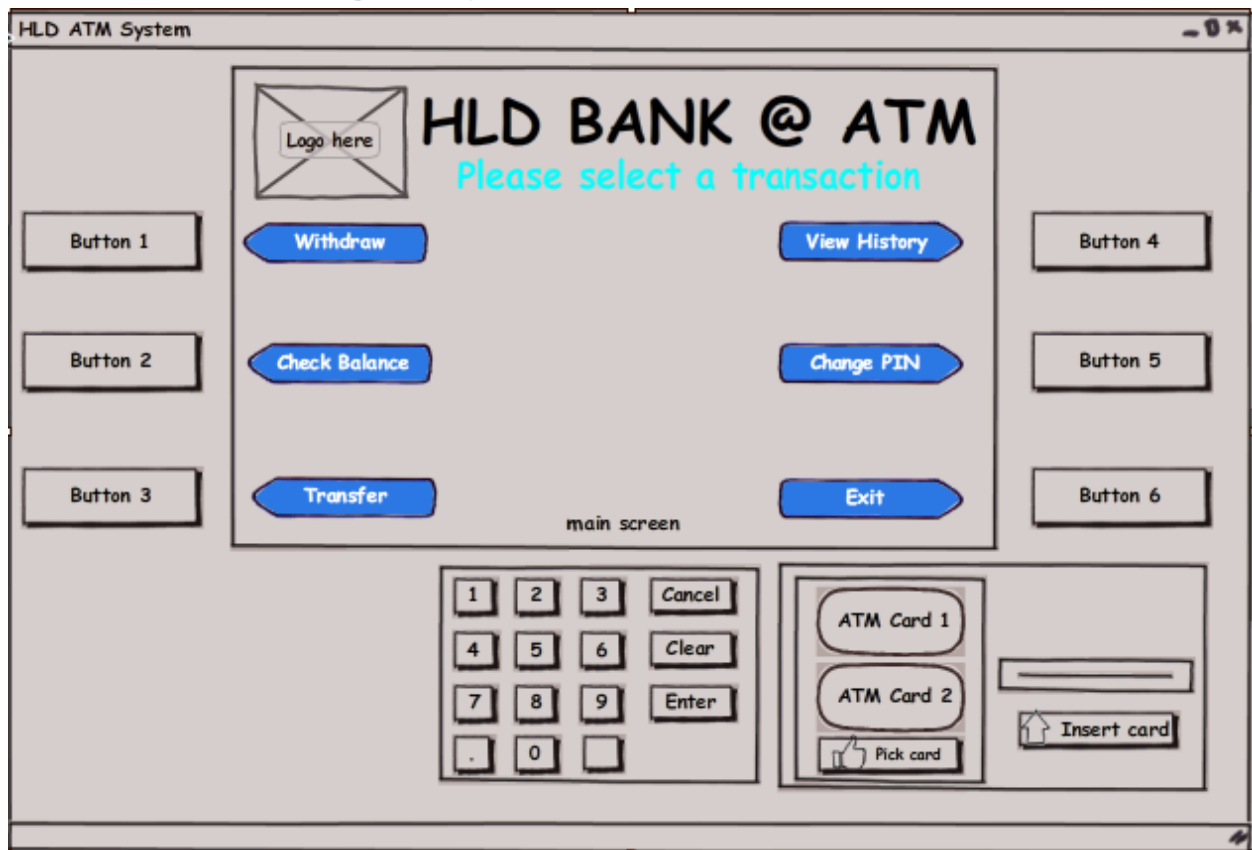

Config				
	Field name	Type	Max Length	Description
1	DateModified	Datetime		Date of modified
2	MinWithdraw	Decimal		Limit minimum of each withdrawal
3	MaxWithdraw	Decimal		Limit maximum of withdrawal for a day
4	NumPerPage	Int		Number of record will display per page in search results screen

5 Application Security

5.1 . Main functions 's security matrix

Usercase	Actor	Customer	ATM
Validation			x
Withdraw		x	x
CashTransfer		x	x
CheckBalance		x	x
ChangePIN		x	x
ViewHistory		x	x
Logging			x

6 Interface Design HuyVQ4

6.1 Layout – HuyVQ4

- A Main screen is aligned top center: use to display all the screen transaction to the customer
 - Bank logo on the top left of main screen
 - Bank Name on the top center of main screen
- There are six (6) fixed button (Button1 -> 6): 3 on the left and 3 on the right: different function with each screen transaction
- Calculator keyboards are under the main screen: button 0 to 9 to input number 0 to 9.
 - Cancel button: used to cancel any transaction.
 - Clear button: used to refresh the input text.
 - Enter button: used to submit the input or confirm customer action.

6.2 Themes

7 Details function design

7.1 Use case 01: Validation – HuyVQ4

7.1.1 Validate Card

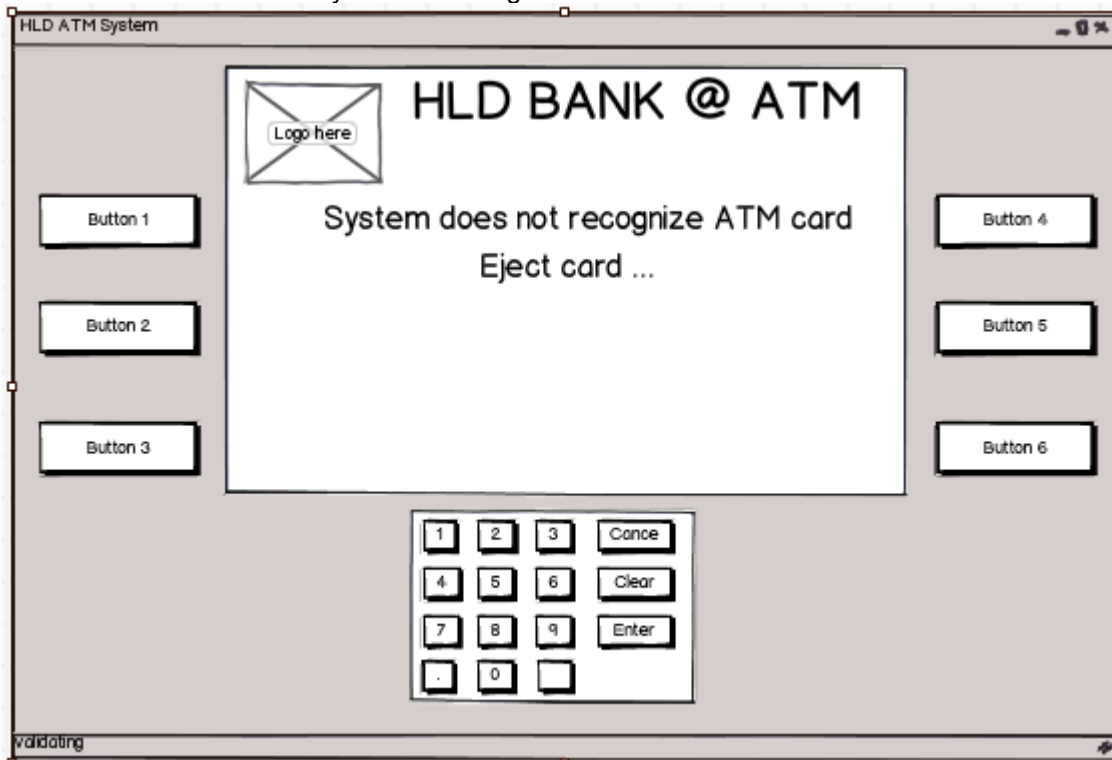

Name	Validate Card
Description	This use case allows ATM system to check the cards which is inputted by user is valid or not.
Actor	ATM System

Trigger	When user clicked on 'Insert Card' button at main screen.
Pre-condition	The card has been inputted into ATM machine.
Post-condition	If the card is valid then next step "Authenticaton" is activated, eject the card if it is invalid.

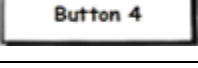

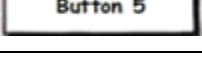

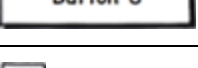

Screen Design & Data Description

SC 01 : Main screen when system validating customer's card

SC 02 : Screen when system does not recognize customer's card is a ATM card or customer insert a card this bank system does not support.

Item	Type	Description
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen
	button	Do nothing at this screen

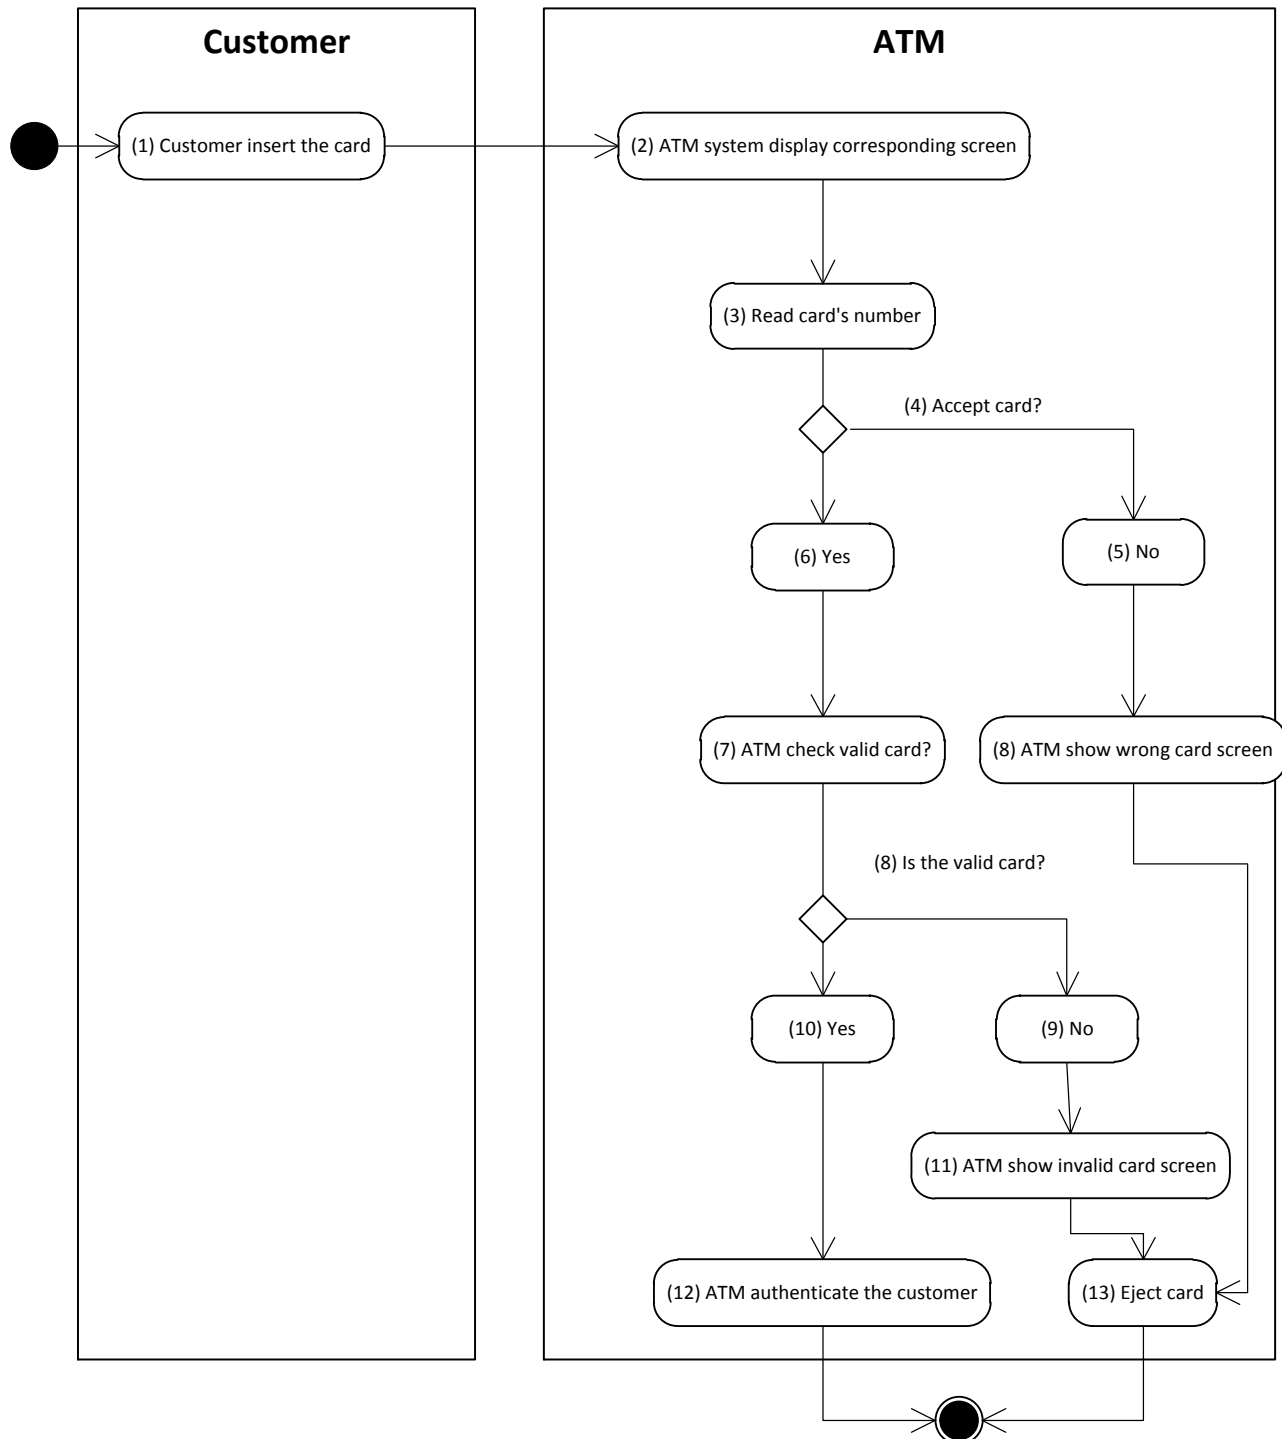

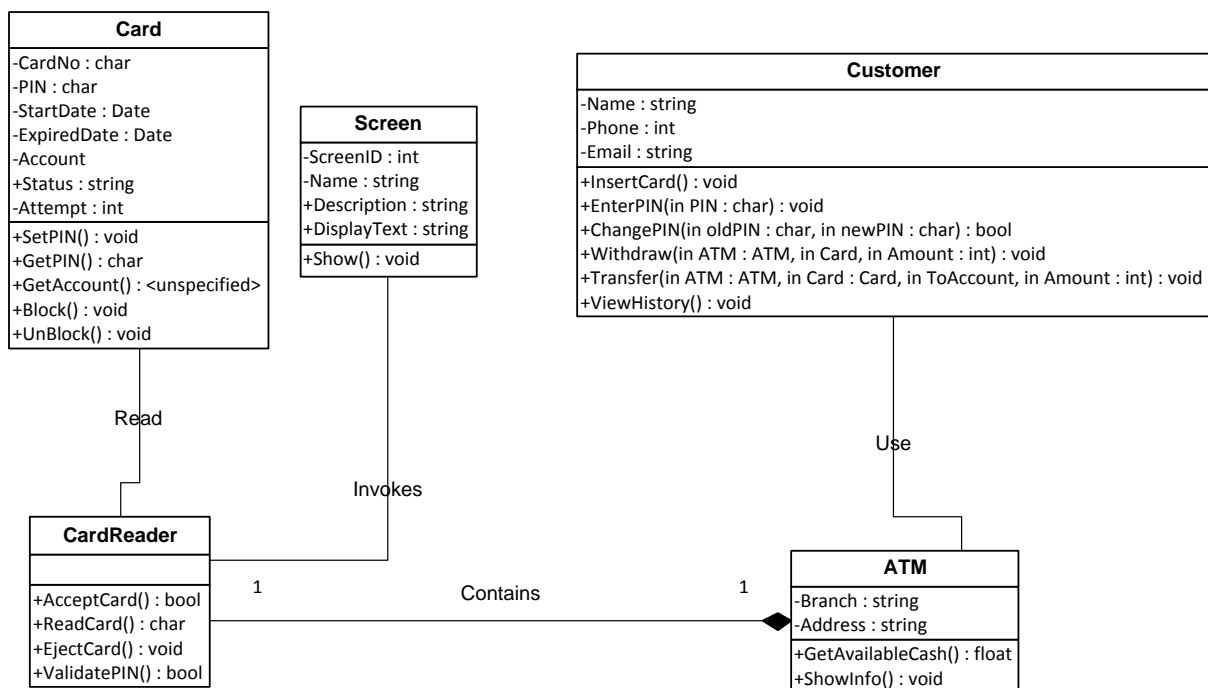

Figure 4.1:Activities Flow

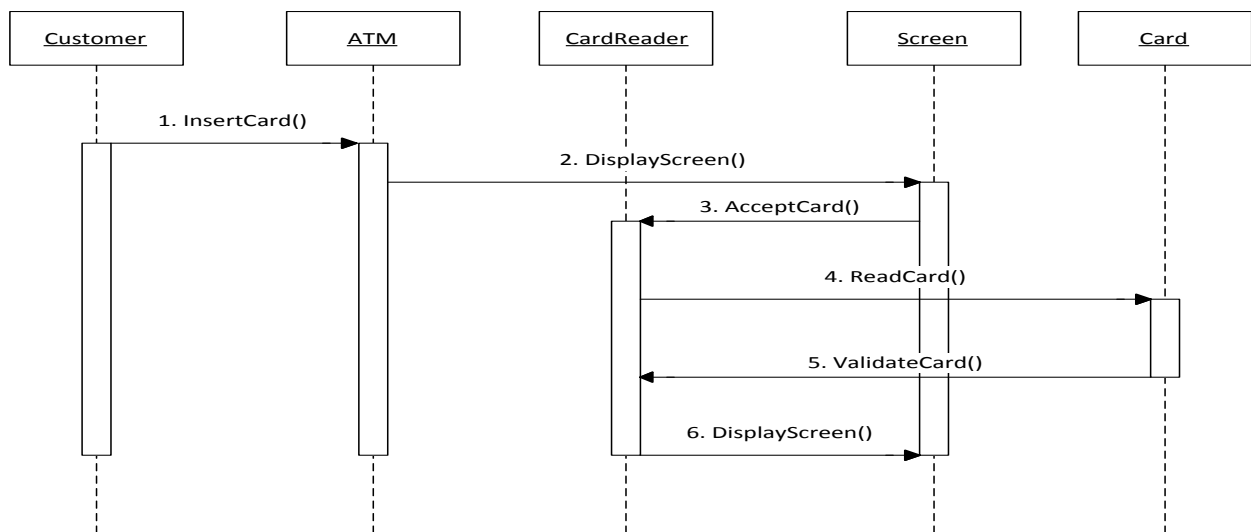

Detail Processing

Activity	BR Code	Description
(3)	BR01	Checking rules: <ul style="list-style-type: none"> ❖ IF <Card Reader> cannot read the card's number THEN <ul style="list-style-type: none"> ➢ Set <<ShowedScreen>> = [Wrong Card Screen]. ➢ Send request to eject card.
(7)	BR02	Checking rules: <ul style="list-style-type: none"> ❖ When user inserted the right card into ATM <ul style="list-style-type: none"> ➢ Get card information from database with card number like the number read from the card was inserted by customer. ❖ IF Card number does not match with any card number in database THEN <ul style="list-style-type: none"> ➢ Set <<ShowedScreen>> = [Invalid Card Screen]. ➢ Send request to eject card.

Class diagram

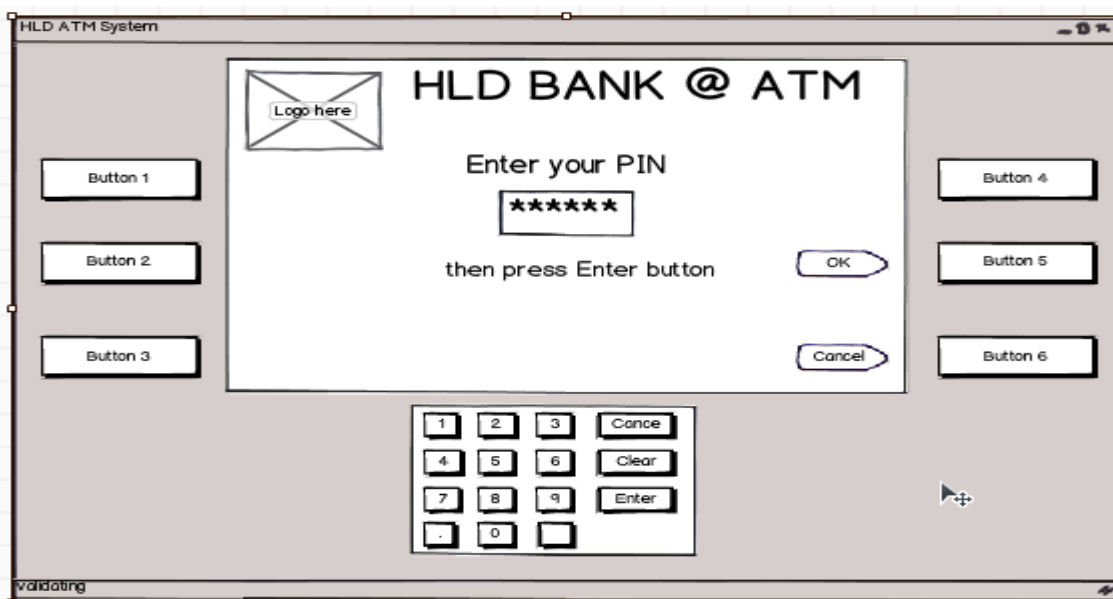

Sequence diagram

7.1.2 Authentication

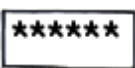

Name	Authentication
Description	This use case allows ATM system to check the PIN which is inputted by customer is valid or not.
Actor	ATM System
Trigger	When user clicked on 'Enter' button or 'Submit'button at [Input PIN] screen.
Pre-condition	The card has been inputted into ATM machine.
Post-condition	Customer was authenticated successfully, ATM system display the select transaction screen.

Screen Design & Data Description

SC 01 : Screen when customer enter their PIN

Item	Type	Description
	button	Submit customer PIN
	button	Cancel function, return to pre-screen
	button	Cancel function, return to pre-screen
	button	Clear text at text box
	button	Submit customer PIN
	Textbox	Input customer PIN
Others button	Button	Do nothing at this screen
	button	Accept input of customer
	button	Accept input of customer
	button	Accept input of customer
	button	Accept input of customer
	button	Accept input of customer
	button	Accept input of customer

Item	Type	Description
7	button	Accept input of customer
8	button	Accept input of customer
9	button	Accept input of customer
0	button	Accept input of customer

SC 02 : Screen when customer enter WRONG PIN, system requires customer to re-enter PIN.

SC 03 : Screen when system validating customer PIN.

Item	Type	Description
All button	Button	Do nothing at this screen
